

Regarding the Kalay Platform Security Mechanism

Date: March 23, 2021

TUTK has developed P2P services for decades. We realize and care about the security of each connection. Therefore, we developed the Authkey mechanism and DTLS in TUTK P2P solution, in addition to TUTK proprietary encryption. The Authkey mechanism provides another layer of P2P connection protection. After enabling the Authkey mechanism, the P2P servers will help to check whether each peer of a connection provides the same Authkey before they can set up a connection. By enabling DTLS, data security will be promised. We encourage our customers to implement Authkey and DTLS. If you need help, please feel free to contact TUTK sales representatives.
